

Synthetic Demo Clinical Guideline

Demo only. This document is synthetic and is not medical advice.

It contains no real patient data and must not be used for clinical care.

This demo guideline describes a fictional adult outpatient condition called Condition G.

It is designed only to test upload, extraction, semantic retrieval, and grounded answer generation.

First-Line Management Pathway

For Condition G, the first-line management pathway is lifestyle counseling, medication reconciliation, baseline lab

The guideline recommends non-urgent outpatient management when the person is clinically stable and has no

Routine follow-up should occur within four to six weeks in this synthetic scenario.

Follow-up includes symptom review, medication tolerance review, laboratory trend review, and confirmation tha

Contraindications

The synthetic guideline says MetaboLite-A should not be used when the person has a known severe allergy to MetaboLite-A. MetaboLite-A should also not be used with unstable vital signs, suspected acute organ failure, pregnancy with

Emergency Warning Signs

Emergency warning signs that require urgent escalation include chest pain, severe shortness of breath, fainting

The guideline says these warning signs require urgent medical evaluation and should override routine follow-up
